

## Fork Positioner for Forklifts

Forklift Fork Positioner - A fork positioner is a device made out of top quality materials meant to be able to withstand the most difficult procedures and work environments. This particular piece of equipment enables the individual driving to be able to work the blades hydraulically without leaving the seat. Side shifting units have the added ability to laterally position the entire load or the arms so as to facilitate more accurate carrying and position in a faster and much more efficient method.

The unique fork pocket design can enable the person operating it to be able to safely swing the unit's blades without any worry of destroying the positioning cylinders. This could allow the operator the option to either execute independent or simultaneous fork movement, depending on the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be converted into blade positioners on available units.
