

Truss Jibs

Truss Jib - A truss jib is actually utilized to be able to carry and position trusses. It is an extended jib additional part that is equipped along with a triangular or pyramid shaped frame. Normally, truss jibs are mounted on machinery like for example a skid steer loader, a compact telehandler or even a forklift utilizing a quick-coupler accessory.

Older cranes have deep triangular truss jibs that are assembled from standard open structural shapes that are fastened utilizing bolts or rivets. On these style jibs, there are little if any welds. Each riveted or bolted joint is prone to rust and thus requires regular maintenance and check up.

Truss jibs are built with a back-to-back arrangement of lacing members separated by the width of the flange thickness of another structural member. This particular design could cause narrow separation amid the smooth surfaces of the lacings. There is little room and limited access to preserve and clean them against rust. Numerous rivets loosen and rust in their bores and should be changed.
